# Five fixes for the article PDF

TileDown 0.16.1 to 0.16.5 are small releases, all about the PDF that comes with every article. None of them changes the web page, the command line or the configuration.

## 0.16.1: embeds and counters print

An embed tile (a video) and a counter tile printed nothing in the PDF, so the sentence before a video pointed at nothing. An embed now prints as a paragraph of its own, `**Title**: <address>`, and a counter prints its label in bold, at the indent of its tile so a list item keeps its list.

## 0.16.3: newer emoji, a closing mark stays with its word

Emoji in a PDF are drawn from the newer Twemoji 17.0.3 face, which covers more of the set, in colour. A full stop, comma or bracket after an inline code span no longer starts a line by itself.

## 0.16.4: a closing mark hangs

In a narrow table cell, a closing mark that touches a code span no longer makes the identifier split in the middle of a word. When the mark does not fit it hangs past the cell edge, and an identifier is cut only when it alone is wider than the cell.

## 0.16.5: Mermaid colours in the PDF

A Mermaid diagram's `classDef` and `class` lines colour its boxes in the PDF as they already did on the page: fill, stroke, stroke width and text colour. Before, the PDF showed an error box and the diagram's source.

## 0.16.2

A fix for the tests only: the print fallback check now runs on committed documents and no longer fails without an environment variable.

## Upgrade

`brew upgrade tiledown`. The full list is on the Changelog page.
