

Tag Intersections

Tag pages are not just flat archives. A reader can start with one topic and then add another tag to narrow the result set.

That makes the demo site useful as a small content browser instead of a static list of links.

Example flow

1. Open the tag page.
2. Select `swift`.
3. The result becomes the intersection of both tags.

The browser checks cover that flow by tapping tag chips and asserting that the result list narrows to matching posts.

:::tile callout title: AND behavior body: Selecting two tags means tag one AND tag two, not tag one OR tag two. :::
