Also in TileDown 0.13.0

- `footer.link` turns the footer text into a link to an absolute `https://` address, so a footer can read "Made by aleahim.com" beside "Built with TileDown". A bad address is an error that names the key.
- `codeCopy: true` adds a Copy button to every code block, by script and only where the browser has a clipboard.
- **A rolling word.** A hero title can roll one word through a list: `title: Docs for {every API|any question}`. The rolling is CSS with no script; with reduced motion or in print the first word stays still.
- **Blank bullets.** A bullet with nothing after it (`-`) among other bullets no longer stops `build-site` with a trap. An empty item renders as `<li></li>`.
- **The 404 page** no longer declares a canonical address or `og:url`, which `tiledown check-links` reported as broken.
- **Long links** such as a repository address used as its own link text wrap instead of widening the page on a phone.
- **A development build says which commit it is.** `swift run stamp-revision` writes the git revision into the build, and `tiledown version` then reads `Tiledown 0.13.0+<revision>`, with `.dirty` when the tree has changes, so it never reads as the release. A release build reads `Tiledown 0.13.0`.
