Links kept, links reported, and a stylesheet that opens from disk

Corpus links are kept

The corpus link schemes `apple-docs://` and `swift-org://` are kept in a link as written.

Dropped links are reported

Any other scheme that is not allowed (`ftp:`, `javascript:`, `data:`) is still not emitted, and the link text stays. What changed is that `build-site` now says so on stderr, one line per link, so nothing is dropped silently:

```
tiledown: warning: <file>: link not emitted, scheme `ftp` is not allowed:
<address>
```

A stylesheet relative to each page

```
relativeStylesheet: true
```

links the shared stylesheet by a path relative to each page (`styles.css`, `../styles.css`, and so on), so a built site opens from disk with its styles. It is off by default, where the link stays `/styles.css`. Only the stylesheet link changes; page links are as before.
