The PDF prints your log windows

TileDown 0.14.1 is a fix for the PDF that comes with every article. Two things were wrong, and both are fixed.

A terminal tile with a source was missing

A `terminal` tile can read its text from a file: `source`, with `tail` and `max-bytes` to cut it, and the `style: manual` and `live: true` options from 0.13 and 0.14. On the page it shows the file. In the PDF it was left out altogether.

Now the PDF prints it. The text is a code block with every line of the file as the build read it, cut the way the page cuts it, and the `title` is a line above it.

Interactive tiles printed their directive

The tiles that only mean something on a screen, `counter`, `price-calculator`, `signin`, `embed`, `newsletter` and `buttondown`, printed their own directive as raw text in the PDF. A price calculator also printed the breakpoints of its table as a bulleted list.

They have no meaning on paper, so they are now left out of the PDF without a trace.

Since version 0.16.1 two of them print something after all: an `embed` prints its title and its address, so the address of a video is not lost, and a `counter` prints its label in bold. The other four stay out of the PDF.

Upgrade

`brew upgrade tiledown`, or download the release from the repository. The full list is on the Changelog page.
