Status pills and progress bars

Two small tiles for a board page. Both are static markup and CSS, with no script.

The pill

Nightly build **blocked**

```
:::tile pill
status: blocked
label: Nightly build
:::
```

`status` is `running`, `waiting`, `blocked`, `done` or `failed`; anything else is a build error that names the five. `label` is an optional short text before the word. The word is always shown, so the color is never the only signal. Each state takes one theme color, so light, dark and a site's own overrides all apply.

The progress bar

Pages written **37 of 120 (30%)**

```
:::tile progress
value: 37
max: 120
label: Pages written
status: running
:::
```

`value` is a whole number from 0 up to `max`, and `max` is the total, 100 when not given. `label` and `status` are optional, and `status` takes the same five words as the pill.

The numbers are written out (`37 of 120 (30%)`, the percent rounded down). The width of the bar is whole hundredths of a percent worked out with integers and rounded down, so a bar is never fuller than its count: 1 of 3 is 33.33%. A value above `max`, and a number that is not whole, are build errors that say so.
