Newest first, even on the same day

This site's Updates page is meant to list the newest post first. It did not, on a day with several releases: posts with the same `date` came out in ascending order of their slugs, so the post for 0.13 stood above the post for 0.14. TileDown 0.15.1 fixes that.

The `order` key

Add `order` to the front matter of a post. It is a whole number. Among posts of the same date, the higher number comes first.

```
---
title: Newest first, even on the same day
date: 2026-11-22
order: 5
---
```

- The date still decides first. An `order` never lifts a post over a later date.
- A post without `order` counts as 0, and so does a value that is not a whole number.
- Posts with equal numbers fall back to the slug, as before.

The feed, the tag pages and the list of recent posts all read the same ordering, so they agree.

The sign-in tile

The sign-in tile had the same fixed two-column row that the subscribe card had in 0.15.0. Its email row now wraps in the same way: the field keeps a minimum width that fits its placeholder, the button keeps its width and does not break its text, and the empty status line takes no room. These are rules in the tile's stylesheet, checked by tests. They have not been measured in a browser by a tool of ours.

Upgrade

`brew upgrade tiledown`. The full list is on the Changelog page.
